

Project Allocation & Requirements

Purpose

The purpose of these mini projects is to give each team member a small, manageable programming task while becoming familiar with Git and GitHub. The coding difficulty should remain beginner-friendly.

Project Allocation

Team Member	Project	Suggested Technologies
Adhvaith Sunilkumar	Task Manager	Python / JavaScript / Java or any other
Allen George	Personal Expense Tracker	Python / JavaScript / Java or any other
Advika E Surjith	Student Grade Calculator	Python / Java / C++ or any other
Jeevasree S	Product Tracker	Python / JavaScript / Java or any other

Project Tasks

Adhvaith Sunilkumar — To-Do List / Task Manager

- Add a task
- View tasks
- Mark a task as completed
- Delete a task

Allen George — Personal Expense Tracker

- Add an expense
- Enter expense amount
- Enter expense category
- View expenses
- Calculate total expenses

Advika E Surjith — Student Grade Calculator

- Enter student name
- Enter marks for different subjects
- Calculate total marks
- Calculate percentage
- Display grade

Jeevasree S — Product Tracker

- Add a product
- View products
- Update product quantity
- Delete a product

- Search for a product

Technology Choice

You may use any programming language or beginner-friendly technology you are comfortable with. The suggested technologies are only recommendations.

Minimum Project Expectations

- The project should be functional and easy to demonstrate.
- Include a README.md file explaining the project.
- The final project must be pushed to your own GitHub account.
- Use Git throughout development rather than uploading the finished folder directly.(that means after you add new features. Push it into your account , rather than pushing it as a single project in the end)

GitHub Deliverables

- A GitHub repository in your own account.
- At least one feature branch.
- A Pull Request from the feature branch to main.
- README.md with project description, features, technologies and run instructions.
- .gitignore where applicable.
- No passwords, API keys, .env secrets, virtual environments or unnecessary generated files.

Final Submission

Submit the following

- Name
- Project name
- GitHub repository link
- Brief description of the project
- Programming language/technology used

You should also be able to explain Git, GitHub, repository, commit, branch, Pull Request, .gitignore, and the commands you used.

Drop your submissions in the google drive that would be provided.
